Shifted windows

# Problem

- Standard transformer : has quadratic complexity to the number of tokens
- Local attention : the complexity become linear to imagesize

# Global self-attention VS Local attention

# Sliding windows VS Shifted windows

(b) Sliding window attention

Efficient batch computation for shifted configuration

# Image Classification on ImageNet-1K

- Results with regular ImageNet-1K training. Compared with the state-of-the-art ConvNets, i.e. RegNet and EfficientNet, the Swin Transformer achieves a slightly better speed-accuracy trade-off
- Results with ImageNet-22K pre-training: achieve significantly better speed-accuracy trade-offs

# Object Detection on COCO

- For different frameworks, Swin-T architecture brings consistent +3.4~4.2 box AP gains over ResNet-50
- For Various backbones, Swin Transformer achieves a high detection accuracy of 51.9 box AP and 45.0 mask AP.
- The best model of Swin Transformer achieves 58.7 box AP and 51.1 mask AP on COCO test-dev, surpassing the previous best results by +2.7 box AP

Conclusion

# Swin Transformer

- (1) hierarchical feature representation
- (2) linear computational complexity with respect to input image size
- (3) achieves the state-of-the-art performance on COCO object detection and ADE20K semantic segmentation, significantly surpassing previous best methods.

Future:

investigating shifted window's use in natural language processing .

encourage unified modeling of vision and language signals

Thank you
